

# Microcontrollers & Applications

Lecture 4.2: Conditionals

# If Conditionals (C & Python)

- If the given **condition** is true, then the **statement** runs.
  - if (condition) statement;

---

- If the given **condition** is true, then the **statement#1** runs, otherwise, **statement#2** runs.
  - if (condition) statement#1;
  - else statement#2;

---

- If the given **condition#1** is true, then the **statement#1** runs, otherwise, if the given **condition#2** is true, then the **statement#2** runs, otherwise, **statement#3** runs.
  - if (condition#1) statement#1;
  - elseif (condition#2) statement#2;
  - else statement#3;

```
if condition:  
    statement
```

---

```
if condition:  
    statement#1  
else:  
    statement#2
```

---

```
if condition#1:  
    statement#1  
elif condition#2:  
    statement#2  
else:  
    statement#3
```

# Case Conditionals (C & Python)

- If `variable_name == val#1`, then the `statement#1` runs,
- Else if `variable_name == val#2`, then the `statement#2` runs,
- Else if `variable_name == val#3`, then the `statement#3` runs,
- Else if `variable_name == val#4`, then the `statement#4` runs.

```
switch (variable_name) {  
    case val#1: statement#1; break;  
    case val#2: statement#2; break;  
    case val#3: statement#3; break;  
    default: statement#N;  
}
```

```
match variable_name:  
    case val#1: statement#1  
    case val#2: statement#2  
    case val#3: statement#3  
    case _: statement#N
```

## ? Conditionals (C)

- `exp#1 ? exp#2 : exp#3 ;`

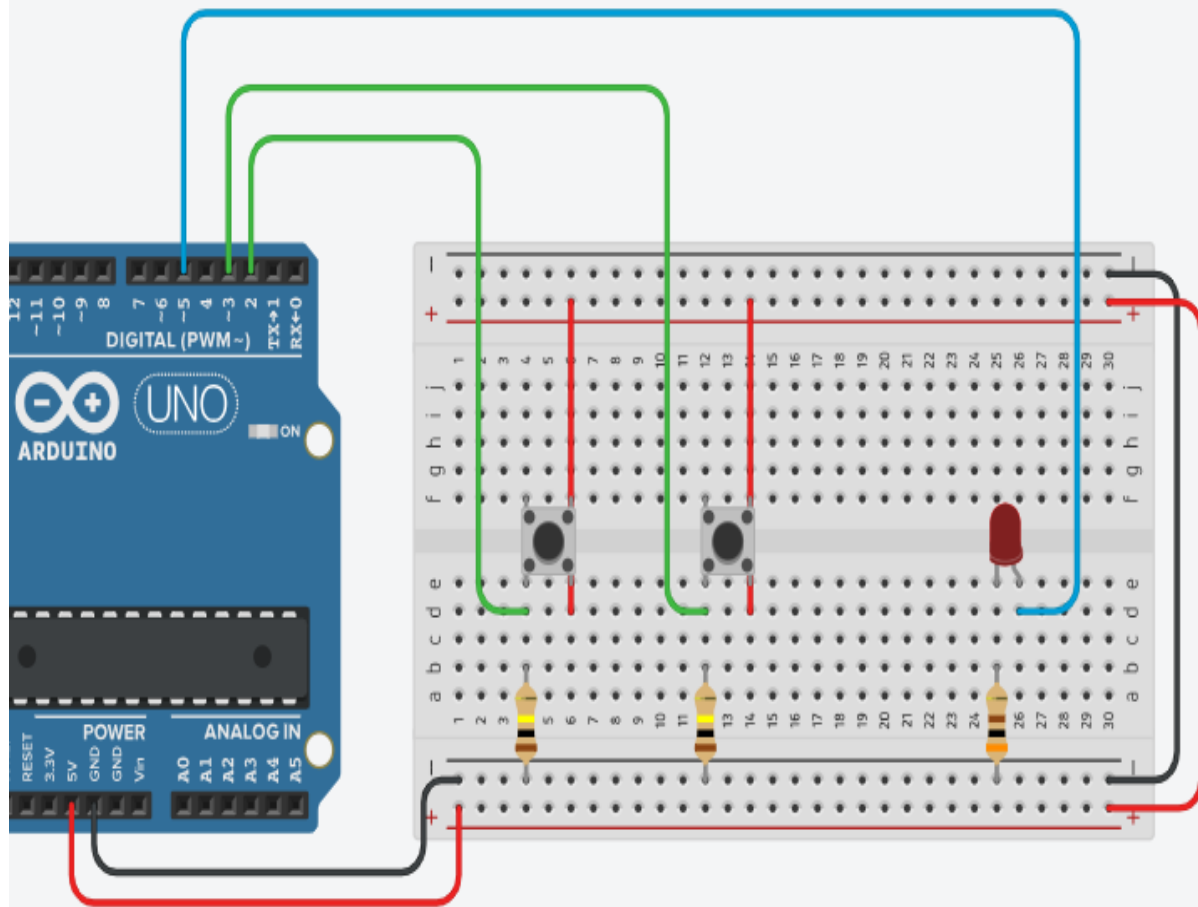

- If `exp#1` is true then the `exp#2` runs, else `exp#3` runs.

```
if (exp#1) exp#2;
```

```
else exp#3;
```

## Conditional Examples #2

```
1 #define BUTTON_1 2
2 #define BUTTON_2 3
3
4 #define LED 5
5 int ledStatus = LOW;
6
7 void setup()
8 {
9   pinMode(BUTTON_1, INPUT);
10  pinMode(BUTTON_2, INPUT);
11  pinMode(LED, OUTPUT);
12  digitalWrite(LED, LOW);
13
14  Serial.begin(9600);
15 }
16
17 void loop()
18 {
19   if (digitalRead(BUTTON_1) == HIGH && !ledStatus) {
20     digitalWrite(LED, HIGH);
21     ledStatus = HIGH;
22     Serial.println("LED is ON now");
23   }
24   if (digitalRead(BUTTON_2) == HIGH && ledStatus) {
25     digitalWrite(LED, LOW);
26     ledStatus = LOW;
27     Serial.println("LED is OFF now");
28   }
29 }
```

Serial Monitor

LED is ON now  
LED is OFF now

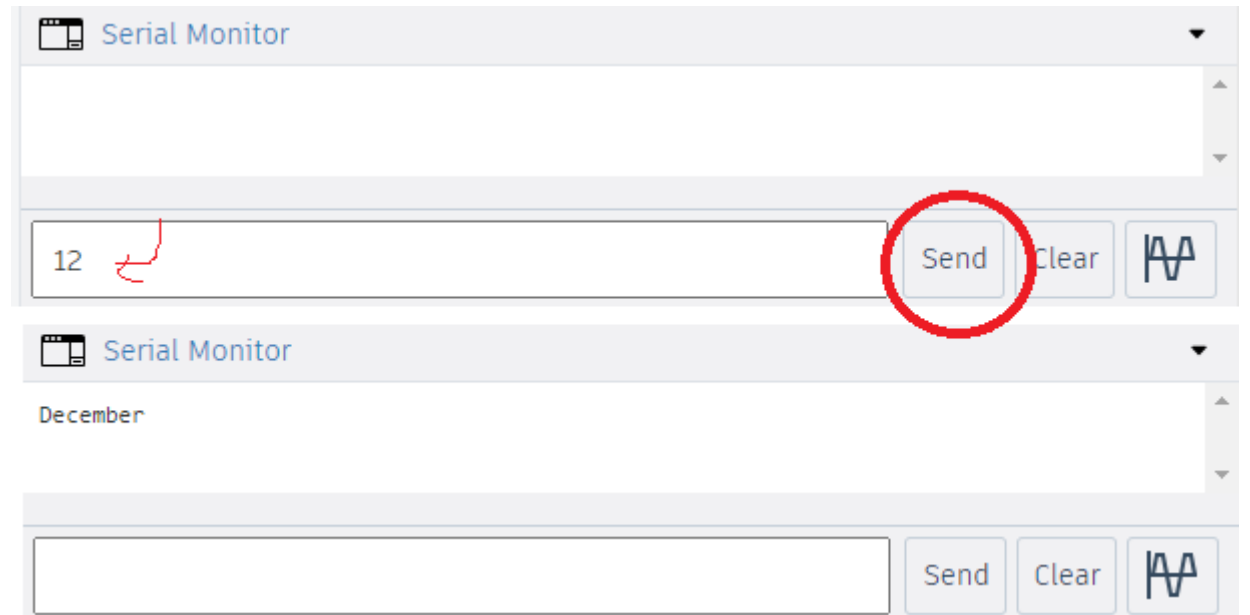

# Conditional Examples #3

```
char *month_string(int m);

void setup()
{
  Serial.begin(9600);
}

void loop()
{
  if (Serial.available()) {
    int x = Serial.parseInt();
    Serial.println(month_string(x));
  }
}
```

```
char *month_string(int m) {
  switch (m) {
    case 1: return "January";
    case 2: return "February";
    case 3: return "March";
    case 4: return "April";
    case 5: return "May";
    case 6: return "June";
    case 7: return "July";
    case 8: return "August";
    case 9: return "September";
    case 10: return "October";
    case 11: return "November";
    case 12: return "December";
    default: return "ERROR";
  }
}
```

## Conditional Examples #4

```
#define POT A0
#define LOW_LIMIT 2.25
#define HIGH_LIMIT 3.25
```

```
void setup()
{
  Serial.begin(9600);
}
```

```
void loop()
{
  unsigned int potValue = analogRead(POT);
  float voltValue = potValue * 5.0 / 1023.0;
  if (voltValue <= LOW_LIMIT)
    Serial.println("LOWER THAN THE LOWER LIMIT");
  else if (voltValue >= HIGH_LIMIT)
    Serial.println("HIGHER THAN THE UPPER LIMIT");
  else
    Serial.println("LEVEL IS GOOD :)");
  delay(1000);
}
```

## Conditional Examples #4 (cont'd)

### Serial Monitor

```
LOWER THAN THE LOWER LIMIT  
LOWER THAN THE LOWER LIMIT  
LOWER THAN THE LOWER LIMIT  
LOWER THAN THE LOWER LIMIT  
LOWER THAN THE LOWER LIMIT  
LOWER THAN THE LOWER LIMIT  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)  
HIGHER THAN THE UPPER LIMIT  
HIGHER THAN THE UPPER LIMIT  
HIGHER THAN THE UPPER LIMIT  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)  
LEVEL IS GOOD :)
```

# Left to Students: Debug & Fix the problem

Please, fix the mistake hidden in the code given on the right 😊

```
#define MT_RATE (0.4)
#define FN_RATE (0.6)
unsigned char mtExam, fnExam, grade;
void setup() { Serial.begin(9600); }
void loop() {
  Serial.println("For a new grade calculation");
  Serial.print("Mid-Term Exam: ");
  mtExam = Serial.parseInt();
  Serial.print("Final Exam: ");
  fnExam = Serial.parseInt();
  grade = MT_RATE * mtExam + FN_RATE * fnExam;
  Serial.println("The grade is " + grade);
  delay(1000);
  Serial.println("\n-----\n");
}
```

# Left to Students: Conditional Examples

- Write the following programs both in Arduino C and Rpi Pico CircuitPython and simulate them:
  1. Find the minimum, maximum, median, and average of the last three numbers read from serial port and report them to the serial port back.
  2. Read the user name from the serial port. If the user name equals to «admin», then request a password and compare it whether «1234» or not 😊. For other users, program sends a message like «Hello Yalcin!» (if the user name is «Yalcin») to the serial port.
  3. There are 4 buttons and 1 LED. Buttons should be added with PULLUP resistors. LED can be BUILTIN\_LED. When one of the first three buttons is pressed at least, then LED is ON. When the 4th button is pressed, then LED is OFF. After 3 seconds waiting, user can activate LED again by pressing one of the first three buttons. Status should be reported in every situation via the serial port.
  4. There are 3 buttons and 1 LED. Buttons should be added with PULLUP resistors. LED can be BUILTIN\_LED. When one of the buttons is pressed & released, then it toggles the status of the LED (i.e. if LED is ON then it becomes OFF and vice versa).

Thanks for  
listening 😊
